

HENLEY CLINIC

Fact Sheet

Eye-bag and Eyelid rejuvenation **“Jett Plasma Treatment”**

A proven, successful and effective alternative to surgery for resolving
Baggy lower eyelids and excess upper eyelid skin

“**Jett Plasma Treatment**” offers a very effective alternative to invasive Blepharoplasty surgery, reducing recovery time and any complications that may arise during and after surgery.

The process has been approved in EU since 2014

HOW DOES IT WORK?

It is a proven approved innovative development used in the UK since 2014 in aesthetic medicine and rejuvenating treatment by utilising the fourth state of matter – PLASMA.

This patented technology removes excess skin by a process called sublimation. The extremely accurate instrument works by creating a plasma (electric) arc which works by heating the skin and creating increased collagen formation locally. The skin then contracts over time, restoring the tightness and tautness to the upper or lower eye area. The resultant tissue retraction and tightening (as opposed to removal) gives results that are comparable to the ones seen with invasive surgery.

This extremely accurate instrument ensures the skin areas can be treated without spreading unwanted heat to any surrounding areas. A safe and effective treatment

CONSULTATION

We start with a full consultation appointment to ensure you are fully aware of all aspects of the treatment, this will be around 30 minutes and allows you the opportunity to ask and discuss any questions you may have. From this and after your consideration we can set your treatment appointment time.

TREATMENT

Your treatment appointment which be approximately 30-60 minutes per treatment session. Local anaesthesia is used to numb the area in preparation for treatment. During the treatment you may feel a mild warming and stinging sensation in the treated areas. Before and after photographs will be taken of the area being treated.

HOW MANY TREATMENT SESSIONS WILL I NEED?

If either just upper eye area or just lower eye area is being treated, the treatment may be completed in one session, this will depend upon a number of factors and your physician will discuss this with you and may need 2-3 treatment sessions

If both upper and lower eye areas are required to be treated, it is very likely this will need to be covered over 2-3 sessions, again you physician will advise the optimum number of treatments for you.

WHEN WILL I SEE THE RESULTS

You will NOT see immediate results. The earliest you will see results is approx. 7 days after the treatment and the treated areas will continue to improve for 3 months following your Jett treatment – so please be patient!

HOW LONG WILL THE RESULTS LAST

The results will last up to 2 years. After this period JETT treatment can simply be repeated if desired.

AFTERCARE

You will need to keep the treated area clean. You will be recommended an aftercare programme to be followed for approx. 7 -10 days. This helps to promote healing and optimise your treatment results. You will also need to protect your eye area from sun exposure until all of the redness has settled post treatment. Your physician will take you through this in detail.

POST TREATMENT

Majority of patients can carry on their normal daily activities directly following the procedure. Although there can be minor discomfort for up to 7 days along with brown marks that have the appearance of scabbing, after around 5 days these will fall off revealing new skin beneath, some swelling may also be seen. A follow up appointment will also be booked approximately 1-2 weeks following the procedure.

You can book for a free and without obligation consultation with our medical aesthetic physicians to discuss your needs requirements and answer any questions you have on the treatment
