

HENLEY CLINIC

FACT SHEET

Ultherapy

The only FDA* cleared Ultrasound system for the proven non-surgical/invasive lift around the face and neck.

“Surgical precision achieved in a non-invasive treatment”

What is Ultherapy?

Ultherapy treatment is designed to send Ultrasound waves deep into the skin that is proven to deliver a;

Non-invasive lift;

1. **Upper face** (Brow and above and below the eye area)
2. **Lower face** (lower cheeks, chin and jowls)
3. **Neck and lower face** (as above including neck)
4. **Full face** (combination of upper face, neck and lower face)
5. **Décolletage**

How does Ultherapy Work?

Ultherapy works by the unique Ulthera equipment delivering ultrasound energy/temperature to depths, precision and optimal lower parts of the skin tissue than cannot be achieved with lasers, radio frequency equipment and other available devices.

The Ultrasound is delivered deep into layers of the tissue where normally only surgery could reach to attain such a lifting result.

The ultrasound energy initiates the body's natural response in these deep tissue areas to stimulate the growth of fresh, new collagen and strengthen weak collagen

The Ultherapy treatment is the only Non-invasive treatment approved to lift skin on face, neck, chin by the very stringent U.S. (FDA food and drug administration)

What can I expect?

- Non-invasive treatment
- No downtime
- Building of your deep collagen
- Natural Results
- One single treatment
- Safety of Ultrasound

Some patients do see an initial effect directly after their treatment, but the collagen does take time to build and results can be seen gradually over a 2-3 month period and will result in positive lifting, tightening and smoothing of the skin on the treated areas.

As this is also your own collagen being built the results will always look natural and not a stretched skin face lift look that can sometimes occur with surgery

How long will the effects of the procedure last?

The Ulthera procedure causes immediate tightening and additional tightening over time. Many experienced physicians have reported results of 2 years or longer based upon the patient's own collagen production and natural ageing process

Who is a good candidate for Ultherapy

A good candidate for Ultherapy is someone with a skin that has relaxed to the point of looking and feeling, less-firm. Lowered brow line or sagging skin on the eyelids is often a good pointer of maturing skin. Typically those in their thirties, forties, fifties and older who have mild to moderate skin laxity are good candidates. Ultherapy is not a replacement for surgery, but there are many people who want some lifting, who are not ready for and/or do not want surgery, either mentally, financially, and/or logistically

Does it actually work and is it safe?

Ulthera is the only Ultrasound device cleared by the FDA (*U.S. Food and Drug Administration) for skin lifting around face and neck

- Over 500,000 treatments carried out worldwide
- Over 3000 systems available globally.
- Over 70 clinical studies/papers on Ulthera.
- Ulthera equipment also has a unique innovation that allows the medical expert treating you to see exactly where in the skin they are treating you

Data from a unique Ultherapy clinical study in which patients had one side of face treated only, proved the much higher rate of collagen growth on the treated side to non-treated side to a significant degree, this level being 42% higher on treated side.

What happens next?

You will need to book for a free and no obligation consultation with our “Registered and Approved Ulthera Medical Expert”.

During this 30 minute meeting you can discuss fully what you are looking to achieve. You will also be taken through an in-depth review of the procedure and potential outcomes. This will also be an opportunity for you to ask any questions you may have.

The Treatment;

- The treatment programme consists of one single treatment.
- The length of the treatment will vary depending upon the areas to be treated 60-90 minutes for face and neck, where just décolletage approximately 30 minutes.
- As the ultrasound is delivered to the precise areas and depth you will feel tiny amounts of energy being delivered. These comfort levels vary from person to person, but the tingling sensation only lasts while the Ultrasound energy is being delivered.

Post Treatment;

- After your treatment you can return normal daily activities, without having to follow any post treatment measures.
- You may see some results straight after treatment, generally results occur over a 2-3 month period
- You may experience some redness for few hours after treatment, this will be temporary for this period
- Not also uncommon to experience slight swelling over a few days again this will be mild and temporary.

The Henley Clinic Standards of Excellence

In the Henley Clinic we have a strict policy to cover and carry out only tried, tested and proven procedures/treatments using only highly trained staff to deliver the treatments and ensure the best results. Our Ultherapy Medical Expert in the Henley Clinic “Sarah Holness” is also the Ulthera company “Merz Aesthetics” UK and European Medical trainer, carrying out training for other medical experts wishing to move into Ultrasound treatment.
